

# REFINERY EQUIPMENT MAINTENANCE SOP

Document ID: SOP-MNT-001 | Revision: 1.0  
DEMO DOCUMENT — FICTIONAL / FOR RAG TESTING ONLY

## 1. Purpose

This procedure defines the basic steps for safely performing maintenance on refinery equipment.

## 2. Scope

This procedure applies to routine maintenance activities on pumps, valves, and other process equipment.

## 3. Safety Precautions

Before starting maintenance, obtain the required work permit, identify the equipment, isolate the equipment, release stored energy, and verify a zero-energy condition. Required personal protective equipment must be worn.

## 4. Equipment Isolation

Isolate all relevant process connections and energy sources. Verify that the equipment cannot be re-energized during maintenance and confirm the isolation status before work begins.

## 5. Maintenance Procedure

Review the work permit, verify the equipment identification, confirm isolation, inspect the work area, perform the planned maintenance, record observations, and complete the required inspection.

## 6. Inspection

Check equipment condition, connections, guards, components, and signs of leakage. Confirm that the maintenance work has been completed correctly.

## 7. Return to Service

Remove tools and temporary materials, confirm that personnel are clear, verify that the equipment is ready, and follow the approved return-to-service procedure.
